Plusiinae of Kashmir: Taxonomy, distribution and new faunistic records (Lepidoptera: Noctuoidea)

Muzafar Riyaz & Savarimuthu Ignacimuthu

Abstract

The present study encompasses twelve Plusiinae species, shedding light on their taxonomy, and geographical distribution. Among these, four species viz. *Chrysodeixis acuta* (Walker, [1858]), *Cornutiplusia circumflexa* (Linnaeus, 1767), *Autographa nigrisigna* (Walker, [1858]), and *Sclerongenia jessica* (Butler, 1878) are reported for the first time from the union territory of Jammu and Kashmir, India thereby adding novel insights to the local lepidopteran fauna. For future scientific endeavors, each of these newly reported species has been meticulously prepared and preserved with mounted specimens and genitalia, ensuring that researchers have access to valuable reference material for further studies.

Keywords: Lepidoptera, Noctuoidea, Plusiinae, new records, Himalayas, Kashmir, India.

Introduction

Boisduval (1829) established the subfamily Plusiinae within the Noctuidae family of moths, using *Plusia* Ochsenheimer (1816) as the type of the genus. The Plusiinae subfamily is notable for its large and well-organized taxonomy. It comprises approximately 500 species globally distributed, found in tropical, temperate, and polar climates (Zahiri & Fibiger, 2008; Ronkay et al. 2008, 2010). The subfamily Plusiinae originated in the Southeastern Palearctic and Eastern Oriental regions, where the majority of plesiomorphic plusiine are located (Kitching, 1987). Members of the Plusiinae subfamily hold agricultural significance. Adult Plusiinae moths are characterized by large scale tufts on the thorax, a convex occiput, few apical styloconic sensilla, semicircular strengthening bars on the most apical portion of the proboscis, dorsal scale tufts on one or more abdominal segments, and a quadrifid
hindwing (vein Cu appears 4-branched) (Kitching, 1987; Shashank & Singh, 2014; Muddasar et al., 2020).

In Jammu and Kashmir, Dar (2014) had documented five species with four new records from subfamily Plusiinae, while Riyaz & Sivasankaran (2022a) recently reported *Anadevidia peponis* as a new record from Jammu and Kashmir. In this study, we provide taxonomic descriptions, distributions, of eight Plusiinae members along with their precisely mounted photographs, which facilitate their straightforward identification.

**Materials and methods**

During insect explorations in the Kashmir Himalayas, nine adult specimens belonging to the subfamily Plusiinae were collected in the agroecosystems of Tehsil Herman of District Shopian, Kashmir (Figure 1). The study area experiences a total annual precipitation of 660 mm and has an average temperature of 25º. It is mainly rural and contains vast agricultural areas. (Riyaz & Sivasankaran, 2022b). The major vegetable crop species around the site were *Brassica oleracea* var. *botrytis*, *Brassica oleracea* var. *capitata*, *Raphanus sativus* L., *Solanum melongena* L., *Phaseolus vulgaris* L., *Solanum tuberosum* L., *Solanum lycopersicum* L., *Brassica oleraceae* var. *virdis*, *Cucurbita maxima*, *Lagenaria siceraria*, *Cyclanthera pedata* and *Pisum sativum* L. The collected specimens were deposited in the museum of the Xavier Research Foundation, St. Xavier’s College, Palayamkottai, India with specimen voucher numbers (XRF-KMR-279-87 and XRF-KMR-GS-280-84). The samples were collected at night using a ProTac HL Headlamp and cotton-wrapped ethyl acetate vials. Photographs of the species were captured using a Xiaomi Redmi Note 8 Pro smartphone equipped with a 20 mm macro lens. The first author collected the specimen during his exploration of the insect diversity in the Kashmir Valley of India. Further taxonomic studies, including the removal and preparation of the genitalia, were conducted. The specimen’s abdomen was cleaned with KOH at 135ºC for several minutes before preparing the genitalia. The prepared genitalia were then rinsed with distilled water, placed in glycerin, and preserved for future analysis.

The identification of the newly recorded species was accomplished by examining the specimen’s morphological characteristics and the genitalia. This process involved utilizing relevant literature such as works of (Zahiri & Fibiger, 2008; Dar, 2014; Twinkle et al. 2018; Twinkle et al. 2020). Through these resources, the species were precisely identified.
Results and Discussion

SYSTEMATIC ACCOUNT

Family Noctuidae Latreille, 1809
Subfamily Plusiinae Boisduval, 1829
Tribe Argyrogrammatini Eichlin & Cunningham, 1978

Anadevidia peponis (Fabricius, 1775) (Figure 2)
Distribution: India, Jammu and Kashmir (Riyaz & Sivasankaran, 2022), Himachal Pradesh, Delhi, Punjab, Karnataka, Bihar, Sikkim. Elsewhere: Korea, Japan, Australia, Russia, Indonesia, Japan, China, Sunderland (Twinkle et al. 2020).

Chrysodeixis acuta (Walker, [1858]) (Figures 3, 10)
Distribution: India, Himachal Pradesh, Arunachal Pradesh, Punjab, Delhi, Kerala, Tamil Nadu, West Bengal, Meghalaya. Elsewhere: Africa, Canary Islands, South Asia, Indonesia, Japan, China (Twinkle et al. 2017; 2020). **New Record for Jammu and Kashmir.**

Chrysodeixis eriosoma (Doubleday, 1843)
Material examined: 2 ♀, INDIA, Jammu and Kashmir, Affarwatt, 34°03′17″N, 74°25′35″E, 4000 m, 21-VIII-2011, Kongdori, 34°02′38″N, 74°25′06″E, 3300 m, 2 ♂, 2-X-2010. Mudasir Ahmad Dar. (Coll. Dept. of Zoology & Env. Sciences, Punjabi University Patiala, India).

Cormutilplusia circumflexa (Linnaeus, 1767) (Figures 4, 11)

Ctenoplusia albostrata (Bremer & Grey, 1853) (Figure 5)
Material examined: 6 ♂, INDIA, Jammu and Kashmir, Ramban, 33°14′25″N, 75°14′32″E, 1780 m, 26-IX-2010, Mudasir Ahmad Dar. (Coll. Dept. of Zoology & Env. Sciences, Punjabi University Patiala, India).

Thysanoplusia orichalcea (Fabricius, 1775) (Figure 6)
Material examined: 1 ♂, INDIA, Jammu and Kashmir, Herman, 33°42′18″N, 74°56′23″E, 1596 m, 18-X-2022, Muzafar Riyaz. (Coll. XRF-KMR-282).
Distribution: India, Jammu and Kashmir, Himachal Pradesh, Uttarakhand, Punjab, Delhi, Kerala, Tamil Nadu, Karnataka, Bihar, West Bengal, Meghalaya, Manipur, Sikkim. Elsewhere: South Asia,

Tribe Plusiini Boisduval, 1928

**Antoculeora ornatissima** (Walker, 1858)

Material examined: 2 ♂, 1 ♀, INDIA, Jammu and Kashmir, Srinagar, 34°11′70″N, 74°77′60″E, 1585 m, 05-IX-2007 (Coll. Rajesh).

**Autographa gamma** (Linnaeus, 1758)

Material examined: 6 ♂, 1 ♀, INDIA, Jammu and Kashmir, Baramulla (Gulmarg), 34°04′84″N, 74°38′05″E, 3000 m, 15-VI-2012. Mudasir Ahmad Dar. (Coll. Dept. of Zoology & Env. Sciences, Punjabi University Patiala, India).

**Autographa nigrisigna** (Walker, [1858]) (Figures 7, 12)

Material examined: 10, INDIA, Jammu and Kashmir, Herman, 33°42′18″N, 74°56′23″E, 1596 m, 18-X-2022, Muzafar Riyaz. (Coll. XRF-KMR-282).

**Euchalcia orophasma** (Boursin, 1960) (Figure 8)

Material examined: 1 ♀, INDIA, Jammu and Kashmir, Taglang La (present day, Union Territory of Ladakh), 34°05′14″N, 74°47′51″E, 5328 m, 03-VII-1994, H. Hacker & W. Ludwig (Coll. NPC-IARI).

**Macdunnoughia confusa** (Stephens, 1850) (Figure 9)

Material examined: 1 ♀, INDIA, Jammu and Kashmir, Herman, 33°42′18″N, 74°56′23″E, 1596 m, 16-X-2022, Muzafar Riyaz. (Coll. XRF-KMR-282).

**Sclerogenia jessica** (Butler, 1878) (Figures 9, 13)

Kashmir’s rich biodiversity in both agricultural and natural ecosystems presents a unique opportunity for further studies and exploration. The relatively unexplored nature of the region’s biodiversity underscores the need for continued efforts to document, understand, and conserve the diverse array of species that inhabit the area. As scientific knowledge advances, there is potential for uncovering even more hidden facets of Kashmir’s ecosystems, contributing not only to academic understanding but also to informed conservation efforts and sustainable management of the region’s
natural resources. The present study has provided a checklist of the Plusiinae species in the Kashmir region, shedding light on their taxonomy, and distribution. The findings of four previously unreported species in Jammu and Kashmir highlights the potential for ongoing biodiversity exploration and research in the area. The meticulously prepared and preserved specimens, along with their genitalia preparations, offer valuable reference materials for future scientific endeavors. The availability of such specimens will undoubtedly contribute to the advancement of research in the field of lepidopterology and promote a deeper understanding of the intricate relationships between different Plusiinae species and their environment.
